DETAILED ACTION

Claim Rejections - 35 USC § 112

1. Claims 7-12 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 7 lines 2-3, the phrase "preferable in a laser scanning microscope" makes it unclear whether or not this recitation is actually a part of the claimed combination. Further, in the last two lines "for the purposes of changing the focal position of the microscope" appears to be a misdescription of the invention, as the specification seems to teach changing the beam focus of the optical tweezers in order to *compensate* for a change in a focal position of the microscope. Finally, "the position of the beam focus" lacks antecedent basis.

In claim 9 "the beam outlet" and in claim 11 "the displacement" both lack antecedent basis, and it is unclear what these phrases are intended to reference.

Inasmuch as the claims are able to be understood in light of the 112 rejections made above, the following rejection(s) apply:

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 7-12 are rejected under 35 U.S.C. 102(b) as being anticipated by Faellman et al made of record.

Faellman teaches an arrangement for a trapping and/or treatment beam including means for changing the beam focus of the trapping beam/treatment beam (note section 5 discussing movement of the lenses in the z-direction). Note that Faellman's device is inherently capable of performing the function set forth in claim 10.

4. Claims 7-12 are rejected under 35 U.S.C. 102(b) as being anticipated by Schutze (US 5,689,109).

Schutze teaches an arrangement for a trapping and/or treatment beam including means for changing the beam focus of the trapping beam/treatment beam (note col. 6 lines 35-40 and col. 7 lines 33-43 which discuss moving a lens or lenses along

the optical axis). Note that Schutze's device is inherently capable of performing the function set forth in claim 10.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Misawa et al, Morito et al, and Nonoda et al all show various arrangements for trapping/treating particles.
